willing to take time out of the lecture to answer your questions. He is also very responsive over email.
Ask questions as the course is going along to make sure you understand what's going on.
Ask questions in precept, and go to office hours.
Complete homework well as that is very indicative of problems on exams
Don't take this course if you have already taken AP Stats. It is essentially the same content, with a little more focus on theory and some use of calculus. Otherwise it is a fine class, not stellar but also not terrible.
Dr. Dytso is very excited about teaching statistics and extremely helpful ? reach out to him with any questions. Precepts are underwhelming, but overall the course is manageable and teaches interesting and highly practical skills.
Easy class if you are in any way good at math. You never have to go to lecture (unless there's quizzes) and you should only go to precept if you actually need help. Not a hard class to get through. Take it if you have to.
Easy course. Open Notes midterm and final. Problem sets and not too difficult or time consuming.
Go to lectures when you can but always review the lecture notes. Office hours are also very helpful
Go to precept if you have questions about the homework/course material. Sometimes lecture slides are not sufficient, so go to lecture if you want worked out examples that the professor gives in class.
Go to the precepts and ask the professor questions.
Good class to give you knowledge about basic statistics. I think the material is good. The lectures started off not so good but it gets better during the semester. The precept is somewhat boring. Try to choose precept that fit you.
Good intro to stats course.
Great class. Alex was excellent and it wasn't as difficult as I expected. Obviously statistics is enormously useful in tons of fields, and in contrast to other courses, ORF 245 will teach you some of the proofs and probability theory that reinforce conceptual understanding of the content. Be prepared to go to every lecture if Alex is teaching, because we have "quizzes" that are basically attendance checks. Going to class is usually worth it though. Precepts are worthless, but you don't really need them to learn the content anyway.
Harder class than it seems on the surface
I took this course with Professor Dytso. I don't think he's ever teaching it again, so this is pretty irrelevant info. He taught it like a High School class and the tests/assignments were way too easy for a Princeton statistics class. All tests/quizzes were open notes, and he gave everyone a cheat sheet for the tests that basically had everything you needed to know on them, so it was just a game of plugging in numbers into equations. Overall an easy A, but I don't think I learned much because it was too easy.
I would advise another student considering taking this course to make sure that they are comfortable with calculus (including some multi) and that they are willing to take on the challenge that the R coding presents. Additionally, they should definitely read the relevant chapters in the text book.
I would recommend this class to anyone who wants an introduction to statistics. It's a relatively easy class with a light workload, I never had to study for the class outside of doing the problem sets and a practice exam.
If Prof Dytso is teaching it, take it! He is a great professor and makes the course very fair. If you study the course work covered, you can expect to do well. Great course!
If you're not taking this as an ORF major or as some other requirement, don't take it. Don't waste your time. Coursework is generally straightforward and easy, but it's just so, so boring. The professor does nothing to engage his students in the material, and basically just helps you regurgitate formulas on tests and problem sets. Take it if you must, but don't expect it to be interesting or worth your time.
If you've already had experience with AP Statistics or have survived Mat201 or above, this class should be relatively easy for you. Alex is a great lecturer and was always open to meeting with me individually outside of class to go over questions. He seems to genuinely love the topics he is teaching and wants his students to succeed.
It is not a difficult class if you follow the lecture slides and solve the problem sets.
It's just ok
It's not a hard class, but it's kind of boring and the lectures can be confusing and feel pointless. Tests were open note and open book.
Just learn it in a group
Keep up with lecture material and you'll do fine
Learning R by yourself can present some challenges, but otherwise if you study from lecture slides you should be ok!
Lectures and precepts are dry, but the assignments are pretty straightforward.
Light workload with Alex Dysto, not a lot of proofs. Would recommend it with Alex Dysto.
Make sure to go to lecture and precept! Problem sets were not too difficult, save some problems, and correlated nicely with the material presented in lecture.
Make sure you go to lecture because he does pop quizzes and sometimes there are examples that he does not write on the slides. Overall Dytso is a great professor, super easy going, and wants his students to do well.
Nice easy class.
Nice to have basic statistical knowledge.

Not a bad course, probably one of the easiest STEM courses I've taken at Princeton (which isn't always a bad thing). It's like a very slightly more rigorous AP Stats if you can imagine that as a class.
ORFEs gotta take it and it's pretty good
Only take the course only if you need to.
Our professor really tried to make the lectures more engaging and more clear. But given the content of this class, some people still found the lectures boring. I think the professor was great, but it's just the class itself is not well designed. Also, before I took the class, I looked at the reviews and there were a lot of complaints about the R programming assignments. However, the actual R assignments are not that hard and there is plenty of help available. SO don't be intimidated by R, and you can consider taking this class if you need some stats foundation.
Read the textbook occasionally to make sure you are on top of everything
Read the textbook, it does a good job of explaining the topics covered in lecture.
Seems much easier/more trivial than it's been in previous years
Statistics
Take a basic course in R programming to save time on the problem sets. Make sure to understand the theory behind maximum likelihood estimators if you want to make solving those problems easier. Approximately 80% of the course is a nice AP Statistics review.
Take it only if you have to, super boring and unnecessary.
Take it with Dytso! He's friendly, nice, and a solid lecturer.
Take this class with Dytso.
The exams and problems sets are difficult. Office hours with the TAs aren't helpful. If you haven't seen statistics before you will struggle.
The material, problem sets, and exams are relatively easy. The course won't cost you too much time. However, you will learn many important concepts in statistics. Also, it is a requirement for the SML certificate. So, I recommend taking this class.
This course is great as it introduces you to the field of statistics in a very natural, intuitive and, at the same time, rigorous way. Prof. Dytso is so well-prepared and knowledgeable. You can talk to him about anything ranging from machine learning to information theory after class. It is a pity he will not teach any longer. However, the course does still prepare you for higher level classes: assignments are fine and exams are really fair as long as you prepare. I hope you will take it!
This course is solid. There is plenty of help available if your should need it. Problem sets are sometimes a bit out there, but always manageable with help. I would take this class.
This course will be easy if you've taken AP Statistics and have a bit of coding experience.
This is a great class to learn about statistics and I'd highly recommend it. Professor Dytso is an awesome guy and will help you if you ever have any questions.
This is an amazing course. Dytso cared about the students. Would recommend to everyone.
Very easy class if you took calculus before. The first half of the semester is just a review of that, and the second is the actual statistics that builds on calculus. Very fair exams and problem sets. Precepts are pretty useless, but not mandatory. Lectures are good and quizzes are mostly to keep track of attendance (they have questions that you can't possibly get wrong). Not an easy A, but definitely an easy A-
Would not take this class unless it's a requirement. It was pretty dry and boring. That being said, it is a pretty easy course, so just do the problem sets and clarify what you don't know with other students, preceptors, and through office hours. Also don't be afraid to ask about RStudio, though fair warning that some preceptors don't even know how to use it even though there are some RStudio coding assignments.
You should be good if you just read the slides and go to precept. If that's not enough for you, go to lecture and office hours.
You will learn a lot about statistics.
not terrible, not too hard
take it if prof. dytso is teaching! if it's another professor, i can't guarantee the same great experience as i've only heard bad things about other professors who teach this course in the past. concepts are easy to understand with prof dytso
